Centralised access management dashboard Add, edit or delete user access settings on the network.	✓	X	X
Active directory integration Easily add a user with one click from the active directory.	✓	X	X

PROXIMITY-BASED WIRELESS USER AUTHENTICATION

GateKeeper uses a computer's built-in Bluetooth, or a USB dongle that serves as non-intrusive authentication detector.

Wireless keys (tokens) are registered for each user on the network and serve as a unique identifier for that individual.

The tokens will be detected and used for authentication when the individual logs into their authorised computers.

CENTRALISED ACCESS USER MANAGEMENT AND REPORTING

The GateKeeper Hub software allows the administrator to deploy security policies such as mandatory 2-factor authentication, access control lists for specific computers, assigning user to workstations, plus reporting and auditing.
